CS261 Coursework Requirements Analysis

Group 17: Ben Lewis, Dan Risk, Edmund Goodman, Jay Re Ng, John-Loong Gao, Rahul Vanmali, Tomás Chapmann Fromm

1 Introduction

This document indicates our current understanding of the proposed project, and will be used alongside Deutsche Bank to clarify our position. We detail and analyse the requirements for a proposed mentoring software platform which should function internally at Deutsche Bank. Many employees want a broader understanding of how different departments within the company work in unison to successfully complete business projects. Alongside this, employees may also have weaknesses in certain business areas, which could be improved by working with more experienced people in different departments. A robust mentoring software platform would solve these issues, by appropriately assigning users knowledgeable mentors who could help them at a personal and professional level.

2 Glossary

- Mentor: The users who can approve a requested meeting and select confirm a date.
- Mentee: The users who can request a meeting in a series of targeted dates.
- **Plan of action:** The future task and achievement milestones that can be created by mentee and mentor, and mentee can mark it as complete or not.
- **Meeting:** This is the event that is held by a mentor and a mentee in a specific time duration. Mentors teach business knowledge to mentees. After the meeting, all users are available to provide feedback.
- Workshop: This is an event that is held by multiple people. The main purpose is to major in mentees' weaknesses.
- **Feedback:** Mentor and mentee can summarise a review with each other, based on their behaviours and sentiment during the whole training period.
- **Group session:** This function is nearly the same as a workshop, except there is no set topic.
- Event: A broad term that means meeting, workshop or group session.

3 User stories

User A has recently graduated from university, and has joined Deutsche Bank in the Human Resources department. Coming from a non-technical background and being thrown into a very tech focused environment has led the user to believe it would be beneficial for them to have a general idea of the technologies they were using worked under the hood. They would therefore like to be paired with an experienced mentor who knows the inner workings of Deutsche Bank's technology system.

User B has been working as a manager at Deutsche Bank for 7 years, and has mentored many employees throughout the years. The user notes that many of the mentees have a keen interest in how conflict in the workplace is handled from a managerial position. Rather than having to teach the same principles repeatedly for each mentee, the user would like a system that would allow them to create group sessions where these management principles could be taught to multiple mentees at once.

User C has recently started mentoring employees at Deutsche Bank, and would like to do as much as possible to ensure their mentoring actually provides value to the mentees. Whilst the user believes the sessions are productive, there's no formal way for them to attain mentee feedback. The user would therefore like a system where mentees could provide feedback after each session. This would then allow the user to make changes about the way they mentor, to maximise their value to each employee.

4 Functional requirements

We used the specification along with our user stories to create our system requirements. We separated the requirements into functional and non-functional, and used the MoSCoW technique to prioritise them. We typeset customer facing requirements as normal text, and developer facing ones italicised.

Functional requirements	Justification	
F00 (Must Have) The user can register an account. The user will	A user account system is necessary for users to	
be able to create an account by providing an email and password, and	d identify themselves and to access the application's	
add data about themselves.	functionality.	
F01 (Could Have) The website will teach new users with tutorials.	Users are provided enough information to fully un-

features of the website will be provided.	ality.	
F02 (Must Have) The user will be able to log into their account	User accounts are required to match up individu-	
using their email and password and reset their password via email if	als. Being able to reset the password by email is	
they need to. The system will check the database to see if a matching	important as people often forget their passwords.	
account exists, and send a password reset link if required.		
F03 (Must Have) The user will have a profile page, allowing them	Users must be able to update their profile page	
to view and modify data. Data includes: their email address; their	to keep the system up-to-date, and the profiles	
name; their job title; whether they want to be a mentor, mentee,	must include their basic information along with	
or both; their business area; 1-5 strengths; and 1-5 weaknesses. A	weaknesses and strengths in order for the system	
"save" button will be used to update any modified data and ensure	to suggest possible mentor and mentee pairing.	
that no essential data is left empty.		

This forms a good compromise between maintain-	
ing the rules of mentoring, and not accidentally	
breaking good relationships	
This ensures that all relationships are mentee	
driven, as they select who they would like to men- tor them, and maintains the rules of mentoring by	
filtering invalid matches from the list.	
This allows the user to gauge which mentor is most	
suitable to them, adding a human element to the matching process, as full automation can never fully account for human opinions.	
This complements the above requirement by sup-	
plementing the human element of matching with a computational one which encourages ones which	
would be good based on feedback and aggregated	
metrics.	
This allows mentors to view the profiles from their available mentees and choose who they think	
would be the best fit, and avoids mentees repeat-	
edly requesting mentors in a short time.	
Clarification of the specification with the customer	
representation was sought, and they stated that mentees can only have one mentor, but mentors	
can have multiple mentees.	
-	
Termination of any mentor/mentee relationships	
can be due to reasons of poor fit. Feedback is also necessary for mentors to improve their men-	
torship.	
This follows the first rule of mentoring where the	
mentee must drive the relationship whenever they	
need unblocking.	
This is to allow for flexibility in meeting time pro-	
posals by the mentor, whilst still following the rule	
of mentors giving up time.	
The mentor must give up time to the mentee so	
this cycle is required. For a meeting to go ahead,	
both parties must be free for it, which is ensured	
here by mentors suggesting times for meetings, and mentees accepting them.	
This follows the rules of mentoring that mentors	
must give up time to their mentees	
This is to allow the recording of discussions and	
for the users to reflect on the meeting where nec-	
essary.	
Additional metrics mean more data which can im-	
prove the way events or mentees are presented by	
the system, encouraging users to make decisions	
the system believes will be more optimal. Plans of action have milestones to keep track of	
the progress made by the mentee. It is important	
the progress made by the mentee. It is important	
for the mentee to have set goals and priorities to work towards.	

F18 (Must Have) When a user starts being mentored, their mentor will be able to see their plan of action. The mentor will only be able to see milestones after they started mentoring the mentee.	The long term goals of a user are not necessarily linked to a mentor, so a plan of action which persists across mentors is beneficial. However, such plans of action may contain sensitive information from the past a mentor should not have access to.
F19 (Should Have) Milestones will be able to be marked as completed by mentees, and if a milestone has not been completed after its target completion date, mentees will be prompted to mark it as complete or update its target date. This prompt will be given the next time the mentee signs in.	This ensures that the mentee is able to see their progress, and the mentor can provide further guidance to the mentee if they remain on a milestone for a prolonged period.
F20 (Must Have) General feedback will be able to be provided at any time. Including free text submissions and updateable numerical metrics, and feedback for specific topic areas will be provided in the same way to refine the suggestion process.	This is so feedback can be provided outside of just meetings and termination of relationships.
F21 (Should Have) If there are enough people with a specified weakness, people identified as experts in that area will be prompted to organise a workshop on it. <i>Using prior feedback, the system can determine if a person is an expert.</i>	Experts are able to run workshops to cover a specific 'weakness' topic extensively and potentially through a group setting.
F22 (Must Have) To create a workshop, the user will set a workshop start/end, and a brief description of what the workshop will cover within the specified weakness category. The workshop will then be registered as an event within the system that anyone can go to.	Information on the workshops can be viewed on the dashboard on the site. The description should provide attendees an idea of what the workshop will focus on.
F23 (Must Have) Group sessions will be created, run, and reviewed in the same way as workshops.F24 (Must Have) Signed in users will be able to submit feed-	Group sessions are equivalent to workshops within the system, with the one difference outlined in the glossary not being in the system. Feedback/bug reports is crucial to the mainte-
back/bug reports to the system. There will be a button at the top of the dashboard that allows you to go to the feedback screen. F25 (Should Have) The user will be able to disclose security	nance and further development of the application. System administrators must be made aware of any
issues. There will be a security txt file [?] for responsible disclosure of security issues - not necessarily requiring the user to be signed in. F26 (Must Have) The system will have a dashboard that gives	security issues, so they can resolve them promptly. Users must be able to navigate the site easily,
a personalised view of the users current meetings, plans of actions, workshops/group sessions and access to the profile page. This will be the main page the user gets placed on when they log in.	so a dashboard where important notifications are shown will facilitate this.
F27 (Must Have) Users will be able to see a list of current workshops. It will be an ordered list of workshops grouped into weeks and then ordered by rating, which can be filtered by the users weaknesses.	This will allow users to easily select workshops most relevant to them.
F28 (Won't Have) The prototype system will not use Deutsche Bank branding. A simple generic theme will be used, which could then later be easily changed to include Deutsche Bank branding.	This is specified as out of scope by the project specification, and it would be simple to change to include it in the future.
F29 (Won't Have) The system will not support video conferencing or messaging. Meetings will be set up as having times, and can then have either physical locations or video conference links included in their description.	This is beyond the scope of the project, as meetings are specified to happen in person, or on a different system. Messaging could be convenient for scheduling meetings, however, this is also out of scope.
F30 (Should Have) Users will have an inbox of notifications which will indicate upcoming events such as meetings or milestone targets. The inbox will be presented as a date ordered list, notifications will be recorded as read or unread, so the number of unread notifications can be indicated to the user.	This allows users to easily keep track of events which are upcoming, as otherwise it would be easy for example to forget about a meeting which was scheduled some time in the future.

5 Non-functional requirements

Non-functional requirements	Justification	
NF00 (Must Have) The system will be intuitive to use and navi-	The user is able to clearly identify the functional-	
gate, even for users with less technical experience. Each part of the	ities of each widget through concise and thorough

6 Team organisation

6.1 Team roles

Team member	Role	Responsibilities
Dan Risk	Project	Schedule meetings, coordinate tasks for group members to balance team
	manager	workload and ensure the project is on schedule to meet the deadline.
Ben Lewis	Website	Design front-end website layout and functions, interpret information sent
Jay Re Ng	developer	from back-end and display it to the user.
John-Loong Gao	developer	from back-end and display it to the user.
Edmund Goodman	Back-end	Implement the system to interpret and process data received from the
Tomás Chapman Fromm	engineer	front-end, provide data to be displayed to the front-end, and manage
Rahul Vanmali	engmeer	effective data storage in the system database.

Additionally, Tomás Chapman Fromm was allocated as Business Analyst, and Ben Lewis and Edmund Goodman as team leaders for website development and back-end engineering respectively.

6.2 Scheduling

In-person group meetings Monday and Friday, as well as additional meetings or collaborative work time to help meet deadlines. Monday meetings to see progress on weekend tasks and set tasks for the week, Friday meetings to see progress on week and set tasks for the weekend.
